APAC SURVEILLANCE
C-UAV CAPABILITIES

12th NOVEMBER 2026

APAC SURVEILLANCE

What Can We Do?

Over land force / facility protection

Over sea / vessel protection

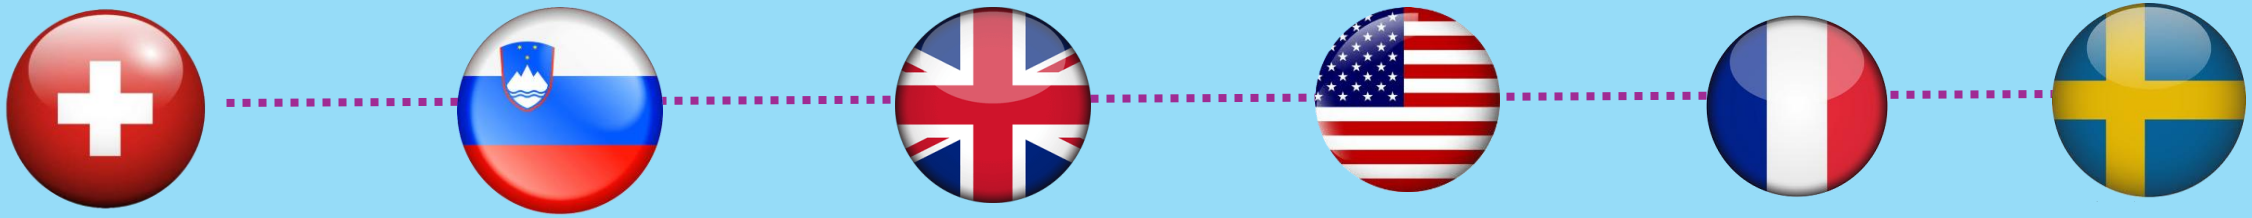

APAC SURVEILLANCE

How Do We Do It?

Given the ‘daily’ developments of drone surveillance, tactics, and countermeasures, no single supplier – least of all a large defence multinational – can credibly claim to be ‘all things’ to a defence client across the full C-UAV spectrum.

Because of our size and our freedom to ‘pick and choose’ compatible C-UAV componentry from global (authorised), cutting-edge and battle-proven suppliers, we can field a defence client a system configured one way ‘today’ and re-configured the next, keeping their forces abreast of the most up-to-date counter-drone technology.
We can therefore also structure finance packages (leases) that keep our clients ahead of the threat, without locking their capability to a single generation of hardware.

APAC SURVEILLANCE

What is your C-UAV defensive power availability situation?

Mobile / Off-Grid
Low power availability
Affordable high-speed magazine **drones**

Fixed high-value infrastructure
Large supply of power available
Laser systems are an option

In a ‘home port’ scenario, a laser C-UAV system is possible/ likely the preferred option; at a temporary mooring, a deployable C-UAV drone system is likely more practical.

CDDS - https://www.cdds.ai/

TRACK AND HARD DEFEAT
+5km to -5km from defensive line
(track and hard defeat)

The CDDS interceptor is an autonomous, kinetic counter drone designed to neutralize Group 1 and Group 2 Unmanned Aerial System (UAS) threats with speed and precision. Powered by onboard AI and real-time decision making, each interceptor detects, tracks, and neutralizes hostile threats independently.

TRACK AND HARD DEFEAT
+ 1 to 3 km from defensive line
(track and hard defeat)

Shot precision
Day & night capability
Immune to jamming
Extreme stealth
Hard kill
Furtive and soundless laser beam
100% hit on target

APAC SURVEILLANCE

The**Orion-H10** (The Worlds widest spectrum C-UAV handheld unit)
Modern battlefield FPV drones are highly customized. Operators often bypass standard commercial frequencies (like 2.4GHz or 5.8GHz) and modify the drones to run on non-standard analog or digital radio links (such as 433MHz, 868MHz, 915MHz, or custom military bands). The Orion-H10 excels here because its 10 distinct frequency bands allow it to jam multiple uncommon or DIY frequencies simultaneously. It essentially creates an un-by passable RF wall, reducing the chance that an FPV operator can slip through on a non-standard frequency.
